

Abstract

A coaster including a highly absorbent pad which is a unique material for coaster design. The pad's porosity directs the condensate away from the drinking vessel preventing fluid buildup on the drinking vessel. The pad is highly durable, does not easily stain and can last for an extended period of time. The removable pad has sufficient strength to accept customized embroidered designs while retaining its durability and absorbent capability. The embroidered designs act to further the effectiveness of the coaster by assisting in preventing surface tension from bonding the drinking vessel and the coaster body.
